MIGALOO

Efforts were being made by various countries and organizations to reduce organic waste production through initiatives like composting, waste-to-energy processes, and promoting sustainable consumption practices. Recycling organic waste can help minimize landfill usage, reduce greenhouse gas emissions, and create valuable resources like compost for agricultural use.

The specific products that can be derived from organic waste depend on the type of waste, the available processing technologies, and local regulations. Effective management of organic waste can contribute to sustainable resource utilization, waste reduction, and environmental conservation.

eco friendly worktops

First Furniture Board Made from Organic Waste

Walnut shell preserves the most precious gift - the seed. It is mold-resistant, hard, non-discoloring, and water-resistant, with a dense structure.

nød

you are never too small to make a difference

Eco-friendly hand made furniture board made of ground walnut shells and tinted resin.

main features

- resistance to water,
- surface you can clean it with normal household cleaners,
- resistance to abrasion,
- resistance to scratches (very easy renewal of the surface),
- resistance to discoloration from fruit juices, red wine, spices,
- the possibility of disinfection with liquids with alcohol and agents such as domestos,
- easily renewable by sanding and re-waxing,
- fastness to discoloration,

nød

you are never too small to make a difference

*„When I was creating the logo of this unusual material I remembered the speech of Greta Thunberg. As a teenager she fought for all of us for the future for her and the next generations and then she uttered the words
„-You are never too small to make a difference...”*

A nut is a seed, from which someday will sprout beautiful strong tree. The shell protects the seed, so that it only hits the ground where it can germinate and develop into a fully mature plant. This furniture board is more than just a piece of furniture. It is like a shield for us like protection against furniture made of formaldehyde full of garbage glued together by whatever it is. The World's first board with such high strength parameters made of biological waste it is unique on a global scale development.”

Monika Blaszkowska - patent owner, inventor
